

## SOLUTION ARCHITECTURE

This diagram represents a job tracking application system in Salesforce. It consists of different components that work together to help users track and manage jobs efficiently.

- The User Interface is where users interact with the system. They can enter job details, track progress, and perform other actions related to job tracking.
- The Job Tracking Module is responsible for managing the tracking of job statuses, updates, and notifications. It keeps track of the progress of each job and ensures that users are informed about any changes or updates.
- The Database stores all the job-related information, such as job details, customer information, and status updates. It acts as a central repository for data, allowing easy access and retrieval of information.
- The Integration Layer connects the job tracking system with other systems or databases. It enables seamless data exchange, allowing the job tracking system to interact with other systems and share information.
- The Reporting and Analytics component provides insights and reports on job performance, customer satisfaction, and other metrics. It helps users analyze and understand the data collected by the system, allowing for informed decision-making.

- The Security and Access Control component ensures that only authorized users can access and modify job-related data. It helps protect sensitive information and maintain the integrity of the system.
